

CLAIMS

1. A governor device comprising:
 - a first lever connecting a governor lever to a rotary speed setting lever interlockingly;
 - a second lever pivotally supported by the first lever; and
 - a third lever pivotally supported by the second lever, regulated its rotation amount by the second lever and interlocked with the governor weight,
characterized in that
 - an elastic member is provided between the first lever and the second lever so as to biases the levers for decreasing the rotary speed for a fixed amount at the time of low speed rotation, and
 - a set load changing means for the elastic member is provided on the first lever near the elastic member.
2. A governor device as set forth in claim 1, wherein
 - a bracket for the elastic member at the side of the first lever is constructed by an elastic plate,
the elastic plate touches an outer peripheral surface of an adjusting shaft, and
 - a distance between the outer peripheral surface of the adjusting shaft and an axis is changed by stages.
3. A governor device as set forth in claim 2, wherein
 - a rotation limiting member is projected from one of ends of the adjusting shaft, and
 - a projection which can touch the rotation limiting member is provided on a plate supporting the adjusting shaft.
4. A governor device as set forth in claim 2, wherein an engaging part for an adjusting operation means is formed on one of sides of the adjusting shaft.
5. A governor device as set forth in claim 2, wherein the elastic member and the adjusting shaft are provided oppositely to a pivotal support part of the first lever and the second lever.
